

Boxcryptor for Schools: Cloud Security for the small budget

Augsburg, November 20th, 2020 — Due to the current situation, the IT security company Secomba GmbH has decided to support schools in digitizing and protecting the personal data of all school members. Public schools of the primary and secondary level will from now on receive the encryption software Boxcryptor with a special discount.

Schools currently have a great demand for Boxcryptor licenses but usually only have a very small amount to spend. For this reason, from now on elementary schools as well as middle schools and high schools can get Boxcryptor at a special price.

The Combination of Cloud and Encryption Software

Boxcryptor is a cloud encryption software that protects sensitive and personal data in cloud storages. The combination of cloud services such as Microsoft Teams and an encryption solution paves the way for schools to use homeschooling and digital forms of teaching.

By storing files in cloud storage, all data is always available and protected against loss. Offerings such as Microsoft Teams also provide a comprehensive learning platform that enables virtual lessons to be held regardless of location. By encrypting with Boxcryptor, schools meet important security criteria of the EU General Data Protection Regulation. This enables all participants to work together securely in the cloud. Important files belonging to students and teachers are encrypted end-to-end before they are transferred to the provider of the cloud storage. This ensures that unauthorized persons never have access to sensitive data.

This Service is Available to Schools

Boxcryptor for Schools is only available for public schools in the primary and secondary level. For a price of 1.200 Euro per year (net) up to 500 user licenses are available, which can be handed out freely between teachers and students. The Boxcryptor Support assists two dedicated contact persons of the school directly in case of questions or problems.

The functions available to the schools include customizable policies that make it easy to comply with compliance measures. In addition, various groups can be created and managed to control data access rights. Furthermore, administrators can also easily track Boxcryptor-related user activities.

Particularly interesting for schools is the integration into Microsoft Teams. With the application, sensitive files that arise in everyday school life can be protected directly in Microsoft Teams using end-to-end encryption.
